

Welcome to SplitMind

SplitMind puts your reading on one side and your thinking on the other. Select any passage in this document, then choose Explain, Summarize or Flashcards. The result appears in the AI Notes pane with a link back to the page it came from.

On an unfolded iPhone Duo the two panes sit side by side. Half-fold the device like a laptop and the document moves to the top while your notes take the bottom. On a standard iPhone, tap AI Notes to slide the panel up over the page.

You can also drag a selection straight into the notes pane, or use Send to AI from the selection menu. Nothing is sent until you choose an action.

Practice passage: how memory consolidates

Spaced repetition is a learning technique in which reviews of material are scheduled at increasing intervals. Each successful recall strengthens the memory trace and lengthens the time before it decays, so the next review can be pushed further into the future.

The forgetting curve, first described by Hermann Ebbinghaus in 1885, shows that retention drops steeply within hours of learning and then levels off. Reviewing just before a memory would otherwise be lost produces a larger gain than reviewing material that is still fresh.

Active recall amplifies the effect. Retrieving an answer from memory, rather than rereading it, forces the brain to reconstruct the knowledge. That effortful reconstruction is what makes the memory durable. Flashcards combine both ideas: they prompt recall, and a scheduler decides when each card should return.

Try it: select this paragraph and tap Flashcards.
